

JHL FlexLine® - Future-Orientated Flexible Solution

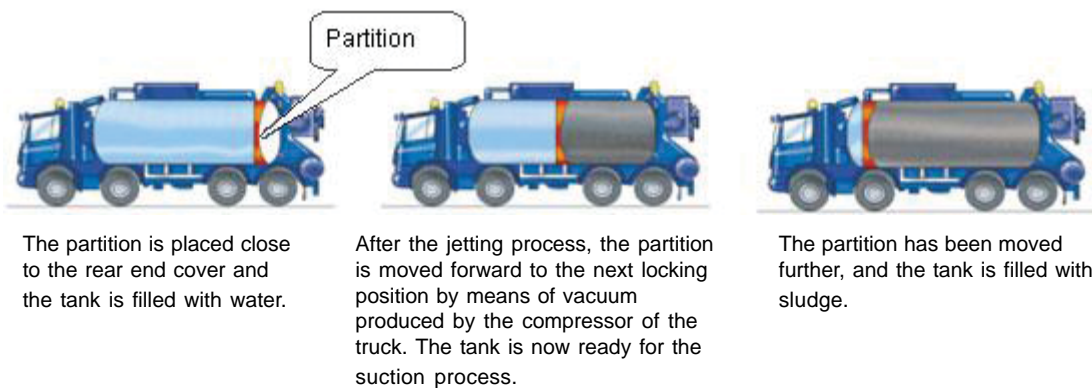

The company of J. Hvidtved Larsen A/S, already the preferred supplier of professional solutions within sewer cleaning tankers, now presents a new concept – JHL FlexLine®, the combined jetting and suction tanker of the future.

Like the name implies, the FlexLine® is a new flexible solution, which the contractor, the municipality may gradually adapt to the requirements that arise.

This new concept permits the customer to purchase a flexible unit without having to predict which requirements he will be having after one or two years. The performance of a FlexLine® tanker rises with the assignments.

The idea of the concept is for the customer to buy a tanker with the exact equipment that he needs for the time being. Should future assignments require additional equipment, a whole range of extra equipment can easily be installed as supplement to the existing equipment. When a FlexLine® tanker leaves the JHL factory, it has already been prepared for further equipment, and by putting off such supplements until a later stage, the customer may spread the investment over several years.

Naturally, a FlexLine® tanker is built to the well-known high quality of J. Hvidtved Larsen A/S.

A movable partition divides the tank in two chambers. The partition is lockable in four positions. The locking bolts for the partition are either manually operated or operated from the control panel by means of pneumatics.
